To See Objects,

Light is scattered from an object in all directions.
A condensing lens (e.g., eye lens, camera, microscope, or telescope) collects the scattered light and focuses it on a screen (the retina in the case of human being).
This creates an image of the object.

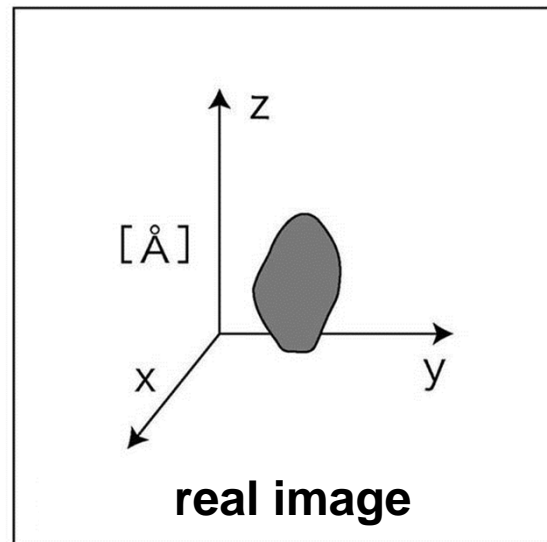

X-rays are necessary for smaller objects (at atomic resolution).
However, lenses for X-rays do not exist, therefore one cannot create an X-ray image.

Scattering and Diffraction

However, the signals are too weak to detect the diffraction image.

Needs amplify the signal!

diffraction image

calculation by computer (Fourier transformation)

Instead condensing lens

Periodic formation of protein molecules

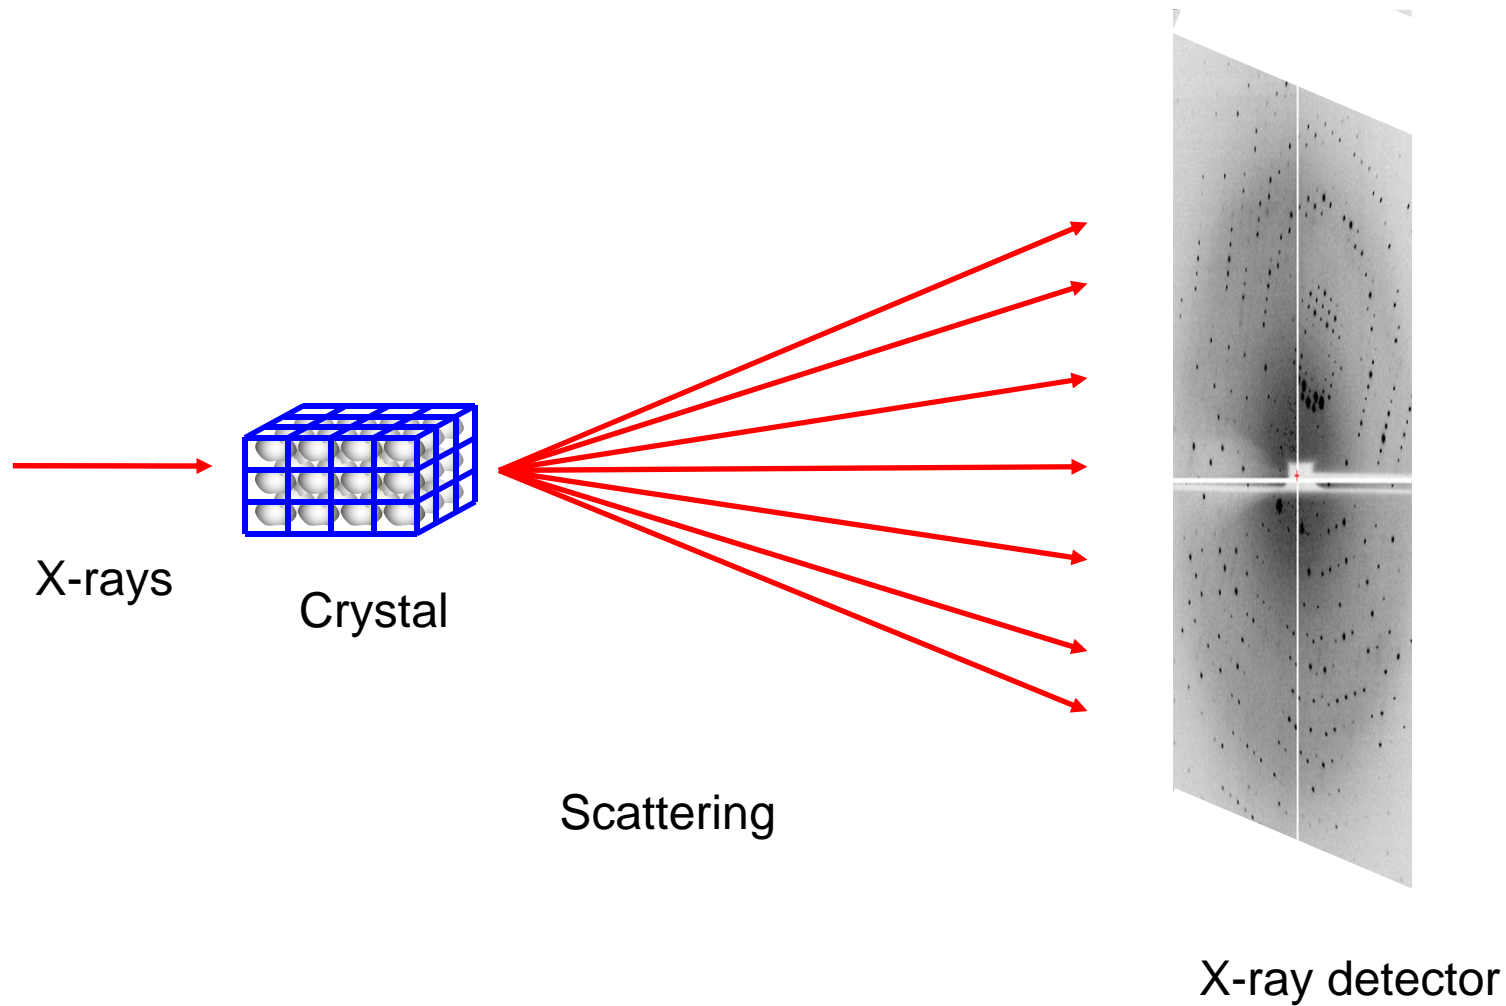

This is two-dimensional arrangement.
If this formation is three-dimensional, it is CRYSTAL.

What kind of images come from a periodic structure ?

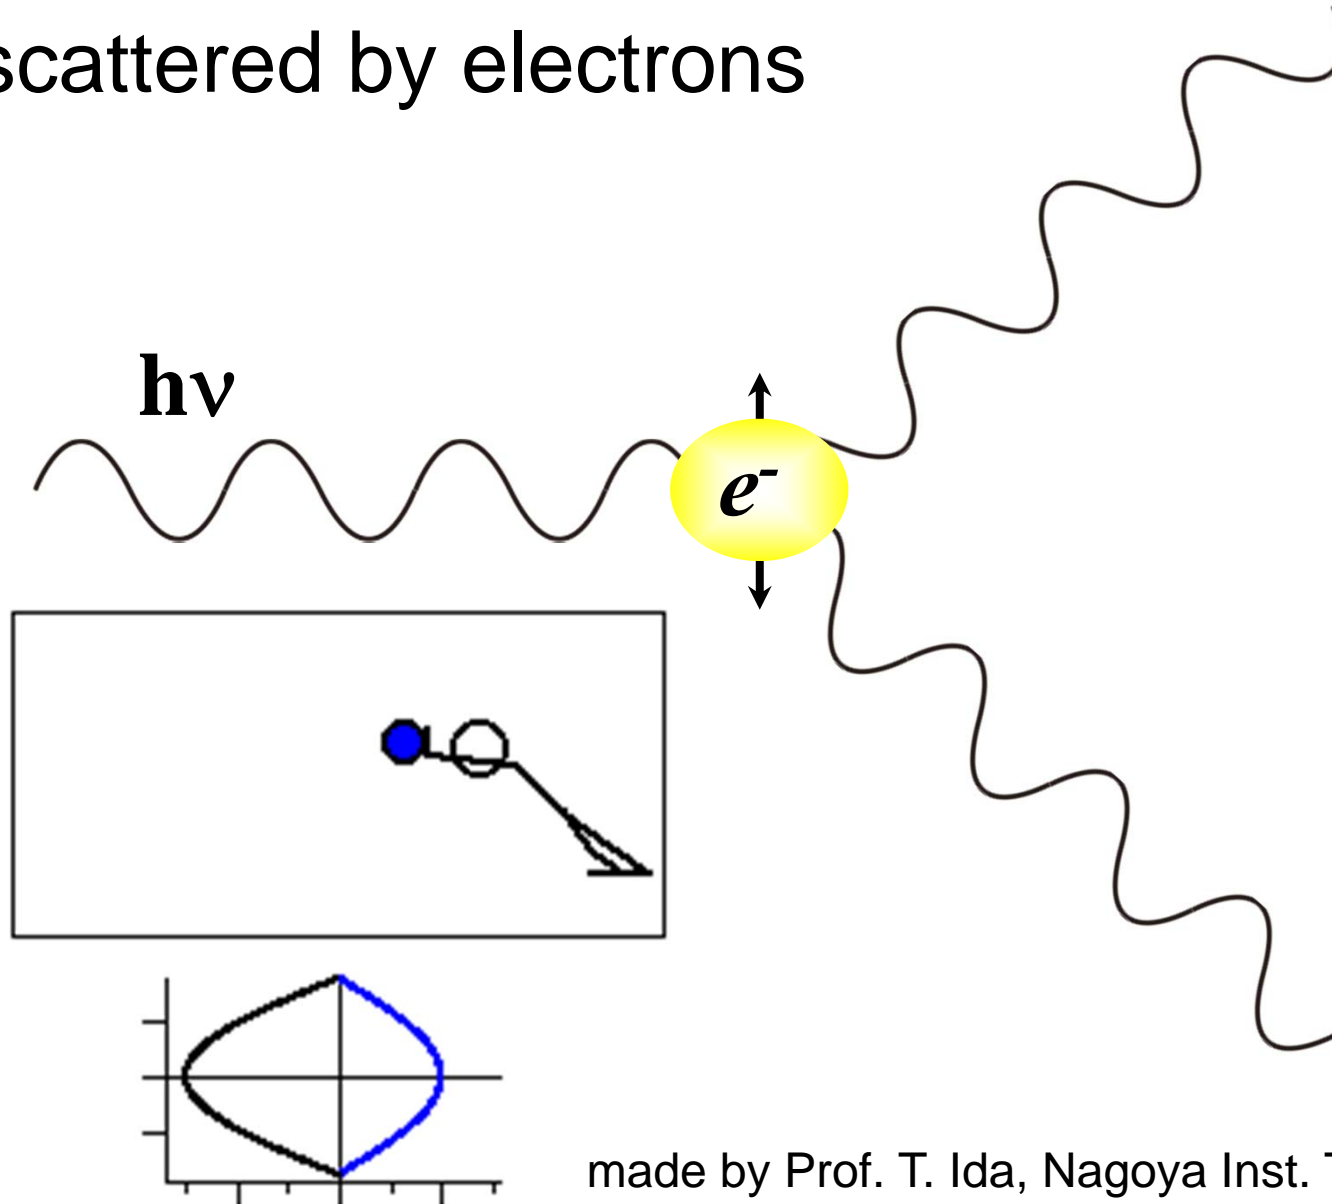

What kind of images come from a periodic structure ?

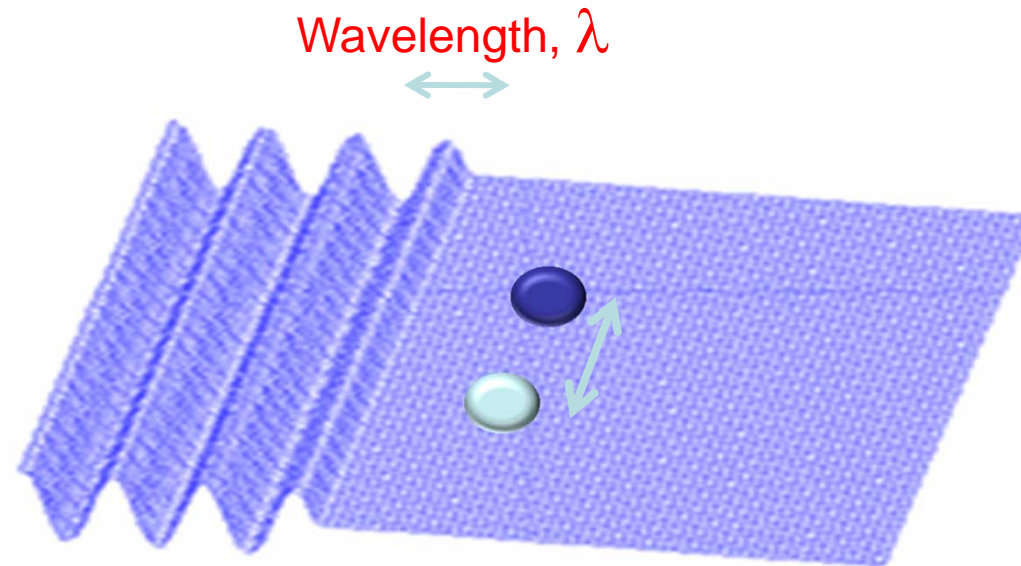

Periodic structure gives periodic diffraction pattern.

X-rays have wave characteristics and are scattered by electrons

made by Prof. T. Ida, Nagoya Inst. Tech

Elastic scattering by two elements

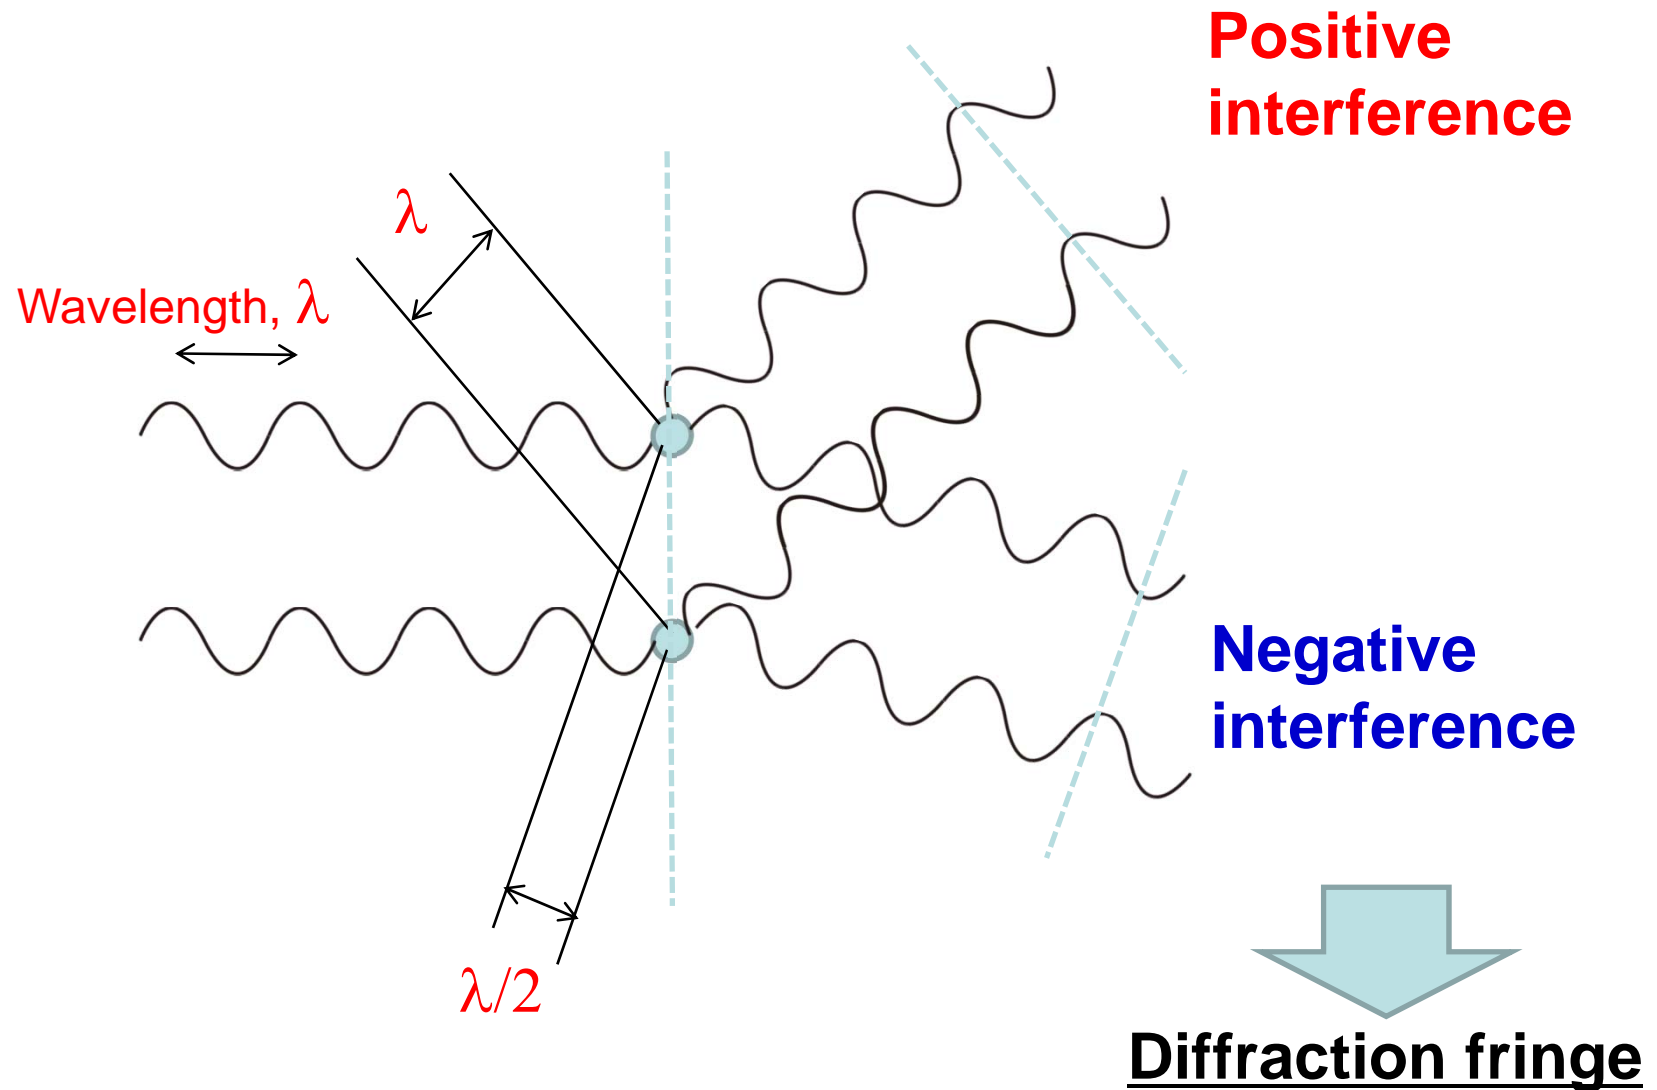

H. Takao

Electromagnetic field vibrates electrons in a material, which give scattering with same wavelength.

→ **Diffraction**

Scattering by two elements

Wave can be expressed on a complex plane

Positive interference

Negative interference

Scattering by two elements

Optical Path difference = $\mathbf{s}_1 \cdot \mathbf{r} - \mathbf{s}_0 \cdot \mathbf{r} = (\mathbf{s}_1 - \mathbf{s}_0) \cdot \mathbf{r}$

$$\begin{aligned} \text{Phase difference} &= 2\pi (\mathbf{s}_1 - \mathbf{s}_0) \cdot \mathbf{r} / \lambda \\ &= 2\pi (\mathbf{k}_1 - \mathbf{k}_0) \cdot \mathbf{r} \end{aligned}$$

($\mathbf{s}_i / \lambda = \mathbf{k}_i$, \mathbf{s}_i is an unit vector, λ is wavelength)

Equation of wave function and sum of waves

$$A(k) = \rho(r_1) \cdot e^{2\pi i k \cdot r_1} + \rho(r_2) \cdot e^{2\pi i k \cdot r_2}$$

↖ ↗
Electron density

Wave from two elements can be explained by multiply of two vectors on a complex plane

Phase differences = distance between elements from a direction

Multiply of waves

Multiplied wave from all molecular elements is expressed as,

$$F(k) = \sum \rho(r_i) \cdot e^{2\pi i k \cdot r_i}$$

Structure factor

Diffraction image is a convolution of scattering pattern of a motif and periodic function.

Single motif

<http://www.ytbl.york.ac.uk/~cowtan/fourier/fourier.html>

Diffraction image is a convolution of scattering pattern of a motif and periodic function.

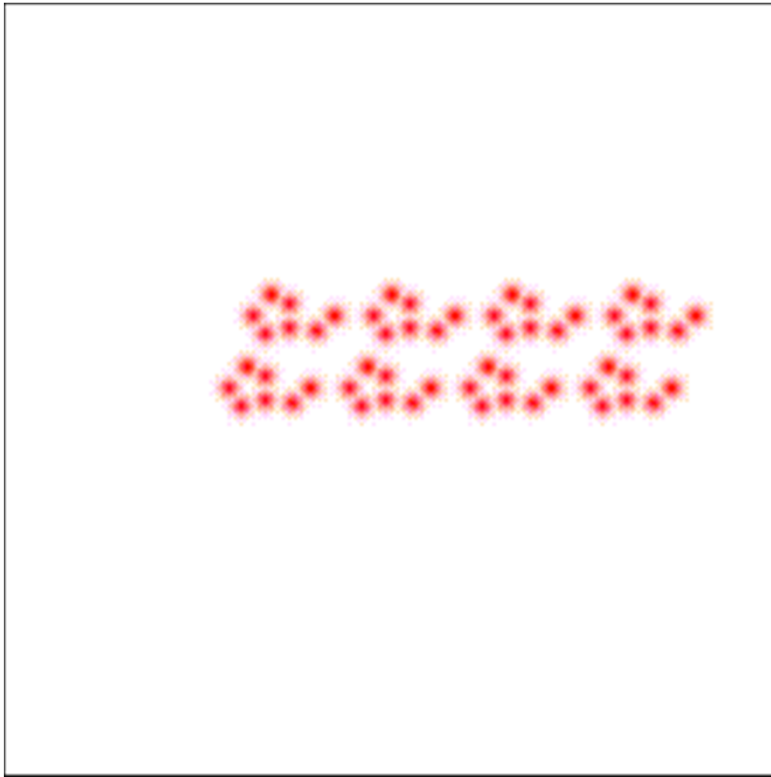

Two translated motifs

<http://www.ytbl.york.ac.uk/~cowtan/fourier/fourier.html>

Diffraction image is a convolution of scattering pattern of a motif and periodic function.

2x4 translated motifs

<http://www.ysbl.york.ac.uk/~cowtan/fourier/fourier.html>

Diffraction image is a convolution of scattering pattern of a motif and periodic function.

5x3 translated motifs

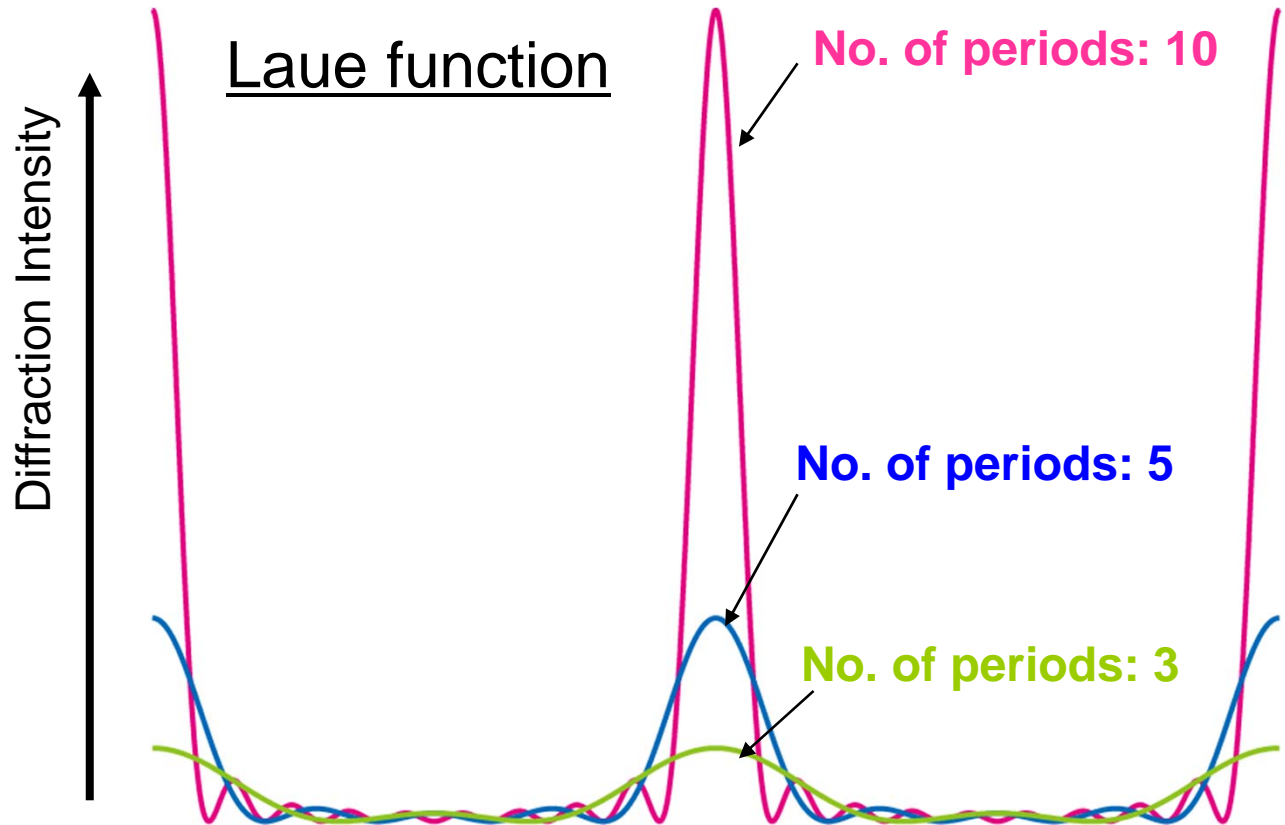

**Scattering pattern is same as single motif.
BUT, the diffraction spots are positioned
according to the periodic formation of motifs.**

Periodic number and Laue function

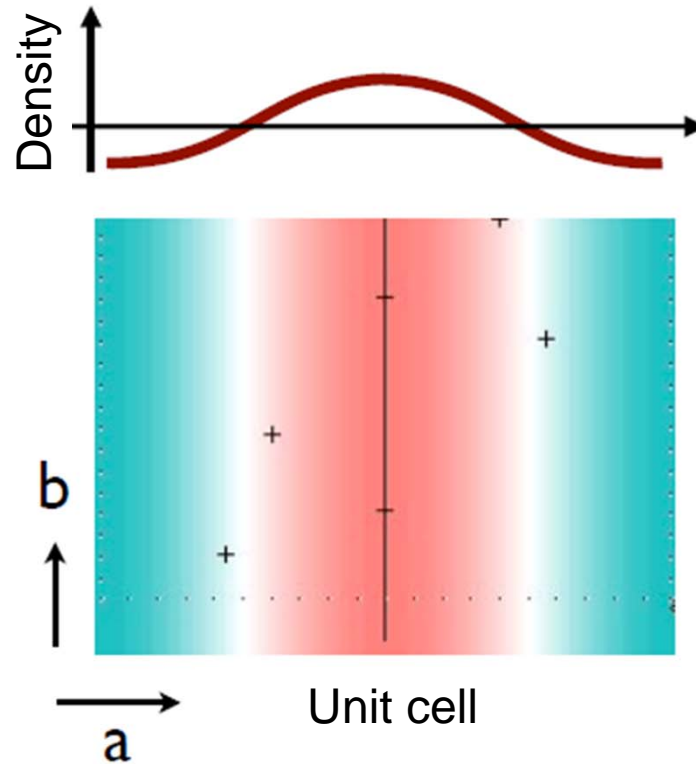

Number of periods \longrightarrow

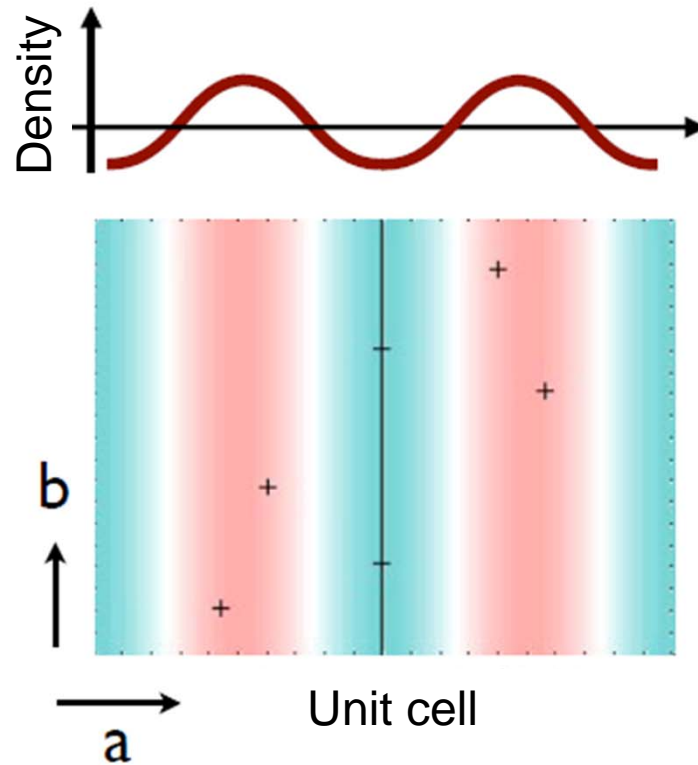

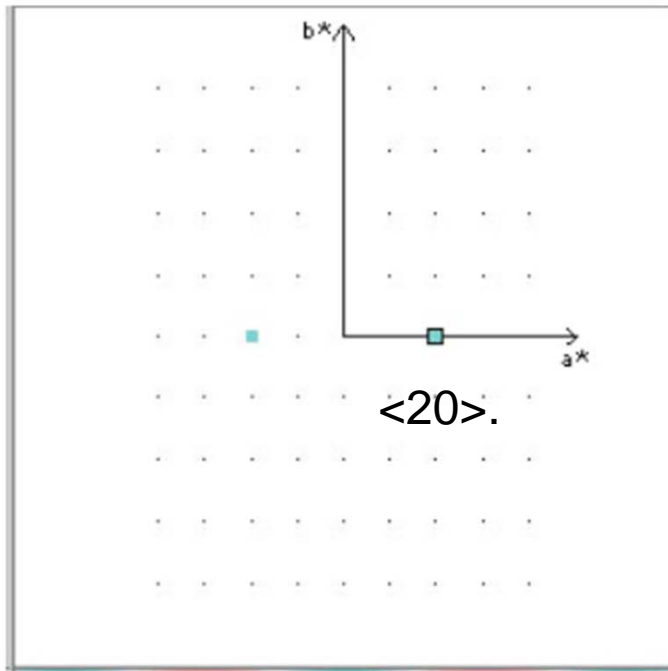

Increase of the No. of periods makes the diffraction intensity stronger.

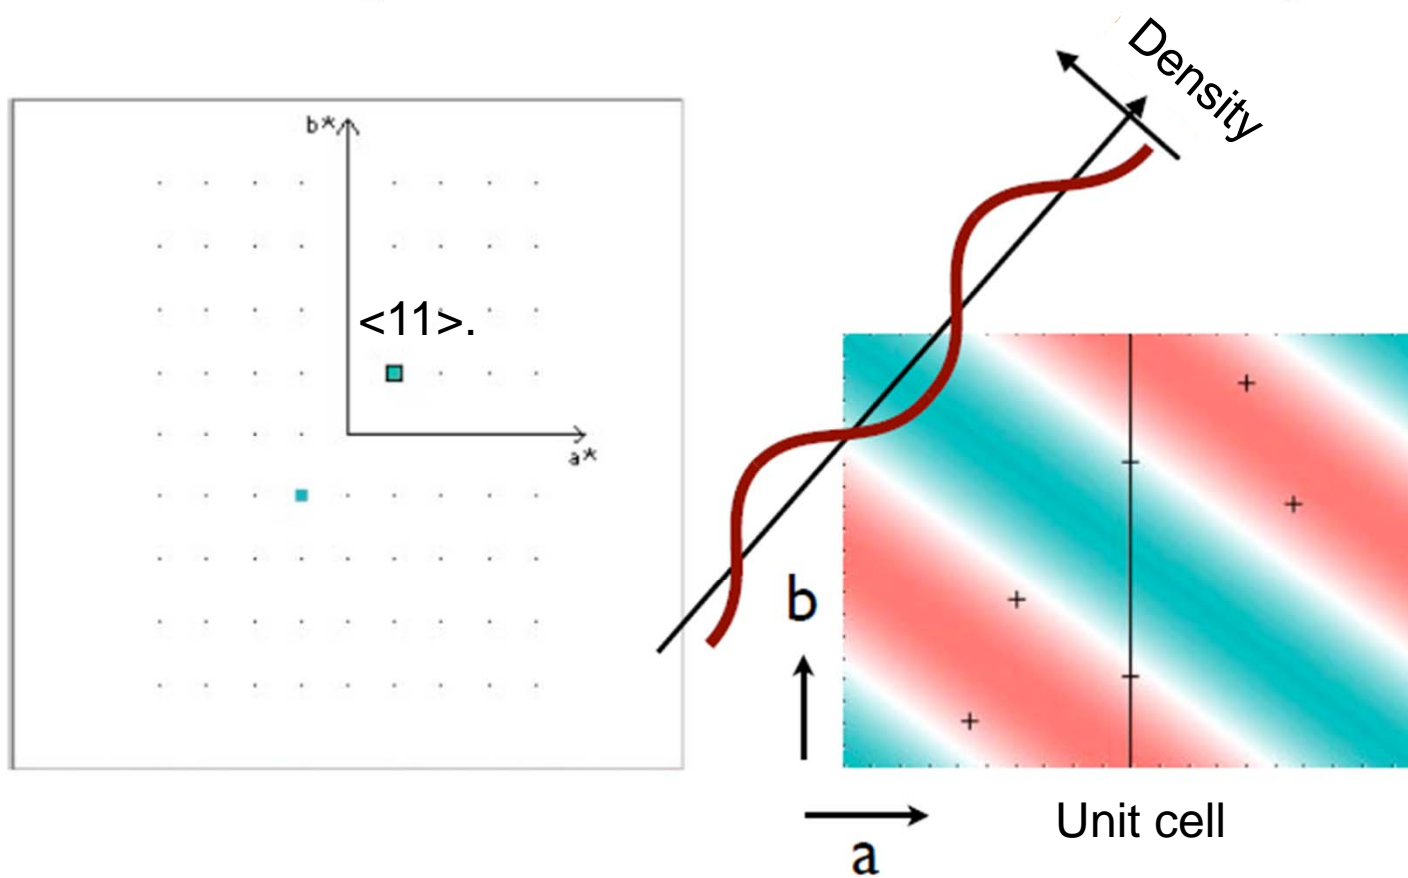

diffraction pattern & Fourier component

diffraction pattern & Fourier component

diffraction pattern & Fourier component

Fourier synthesis

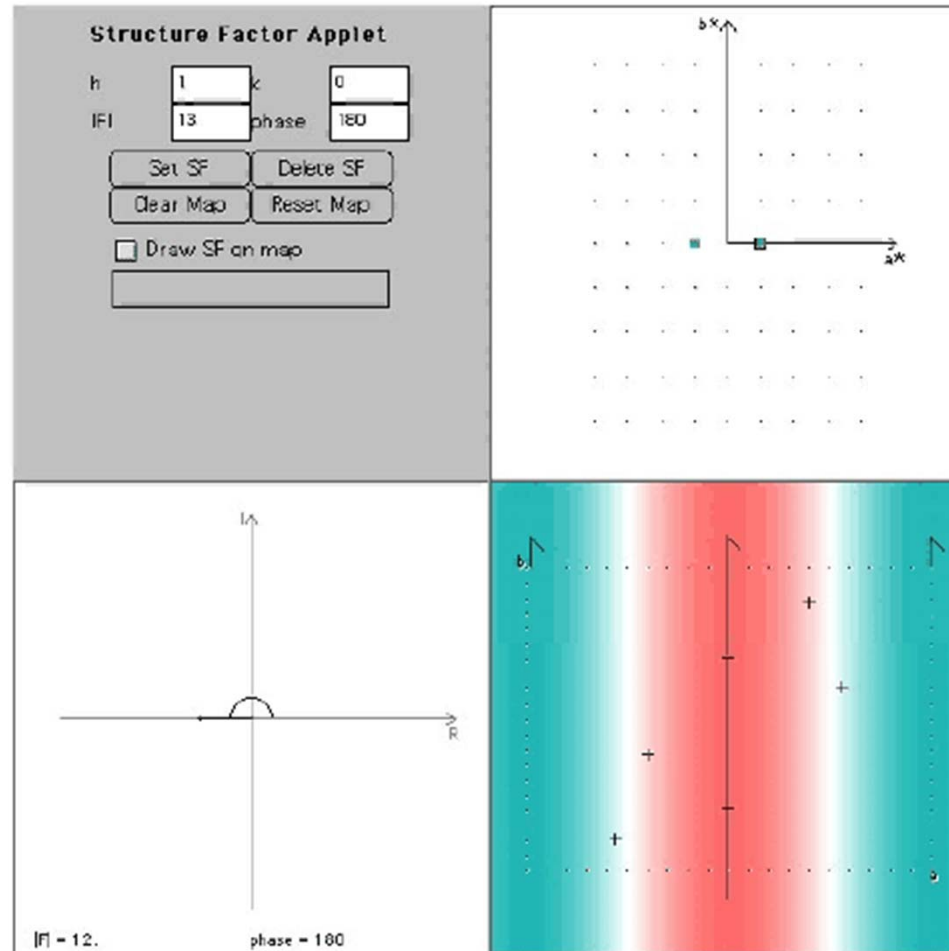

Fourier synthesis

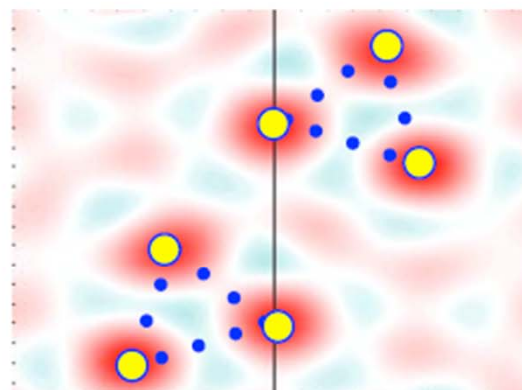

Summation of all waves (Fourier synthesis) can reconstruct the object, like computer tomography (CT)

Fourier synthesis

<http://www.yybl.york.ac.uk/~cowtan/fourier/fourier.html>

Fourier synthesis

Fourier synthesis

$$\rho(x, y, z) = \sum_h \sum_k \sum_l \mathbb{F}_{hkl} e^{-2\pi i(hx+ky+lz)}$$

Structure factor $F(\mathbf{k}) = \int \rho(\mathbf{r}) e^{2\pi i \mathbf{k} \cdot \mathbf{r}} d\mathbf{r}$

Electron density $\rho(\mathbf{r}) = \int F(\mathbf{k}) e^{-2\pi i \mathbf{k} \cdot \mathbf{r}} d\mathbf{k}$

F(k) and ρ(r) have a relationship of Fourier transformation.

Atomic scattering factor $f(\mathbf{k}) = \int_{\text{atomic}} \rho(\mathbf{r}) e^{2\pi i \mathbf{k} \cdot \mathbf{r}} d\mathbf{r}$

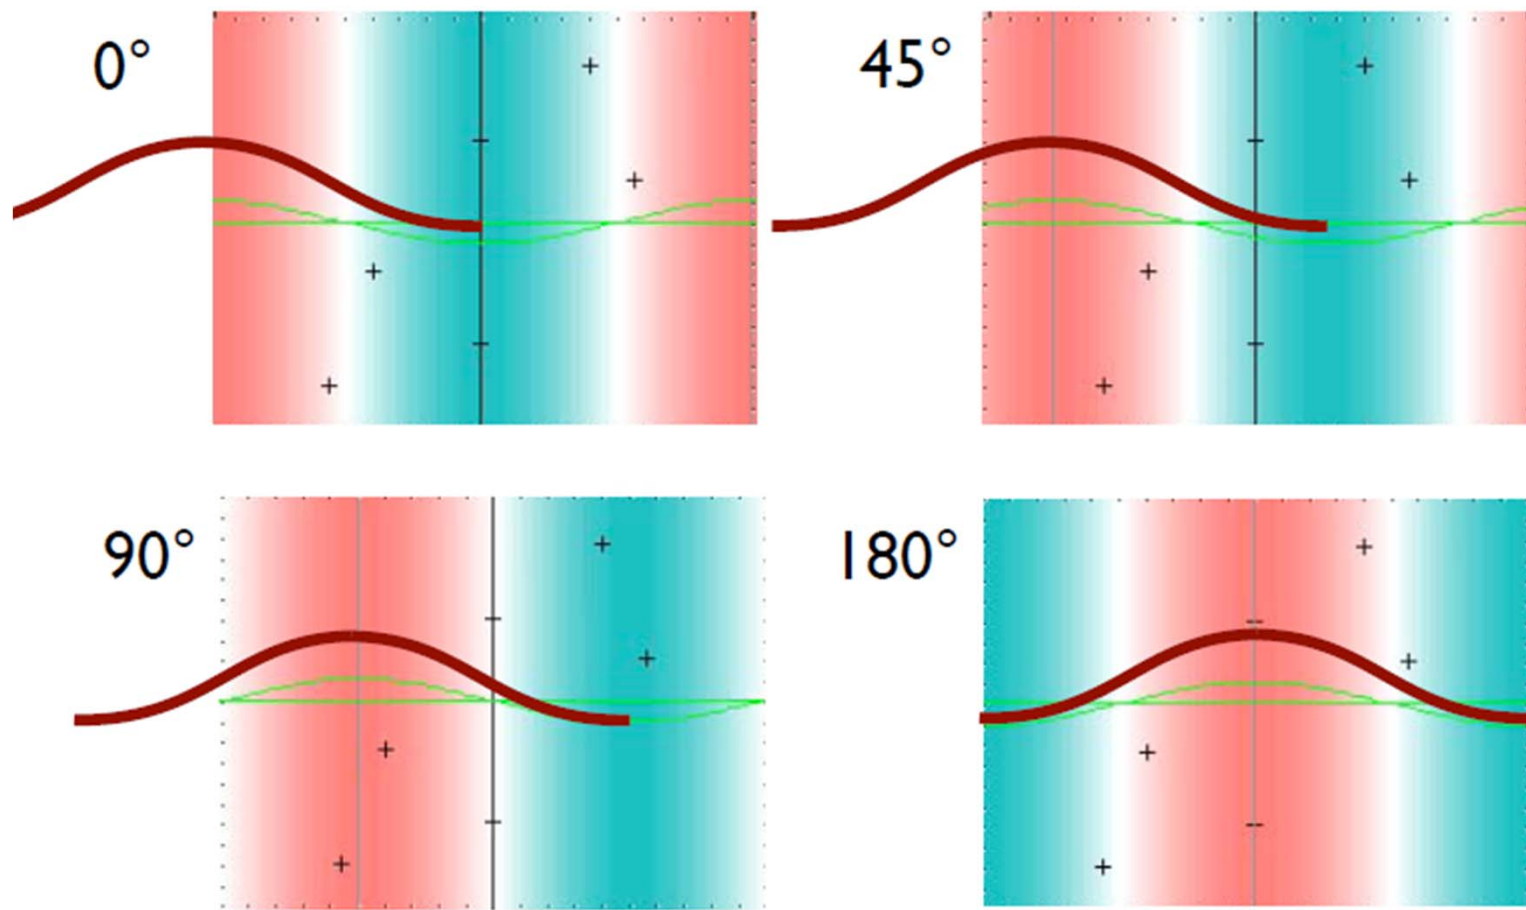

Using this,

Structure factor $F(\mathbf{k}) = \sum_j f_j e^{2\pi i \mathbf{k} \cdot \mathbf{r}_j}$

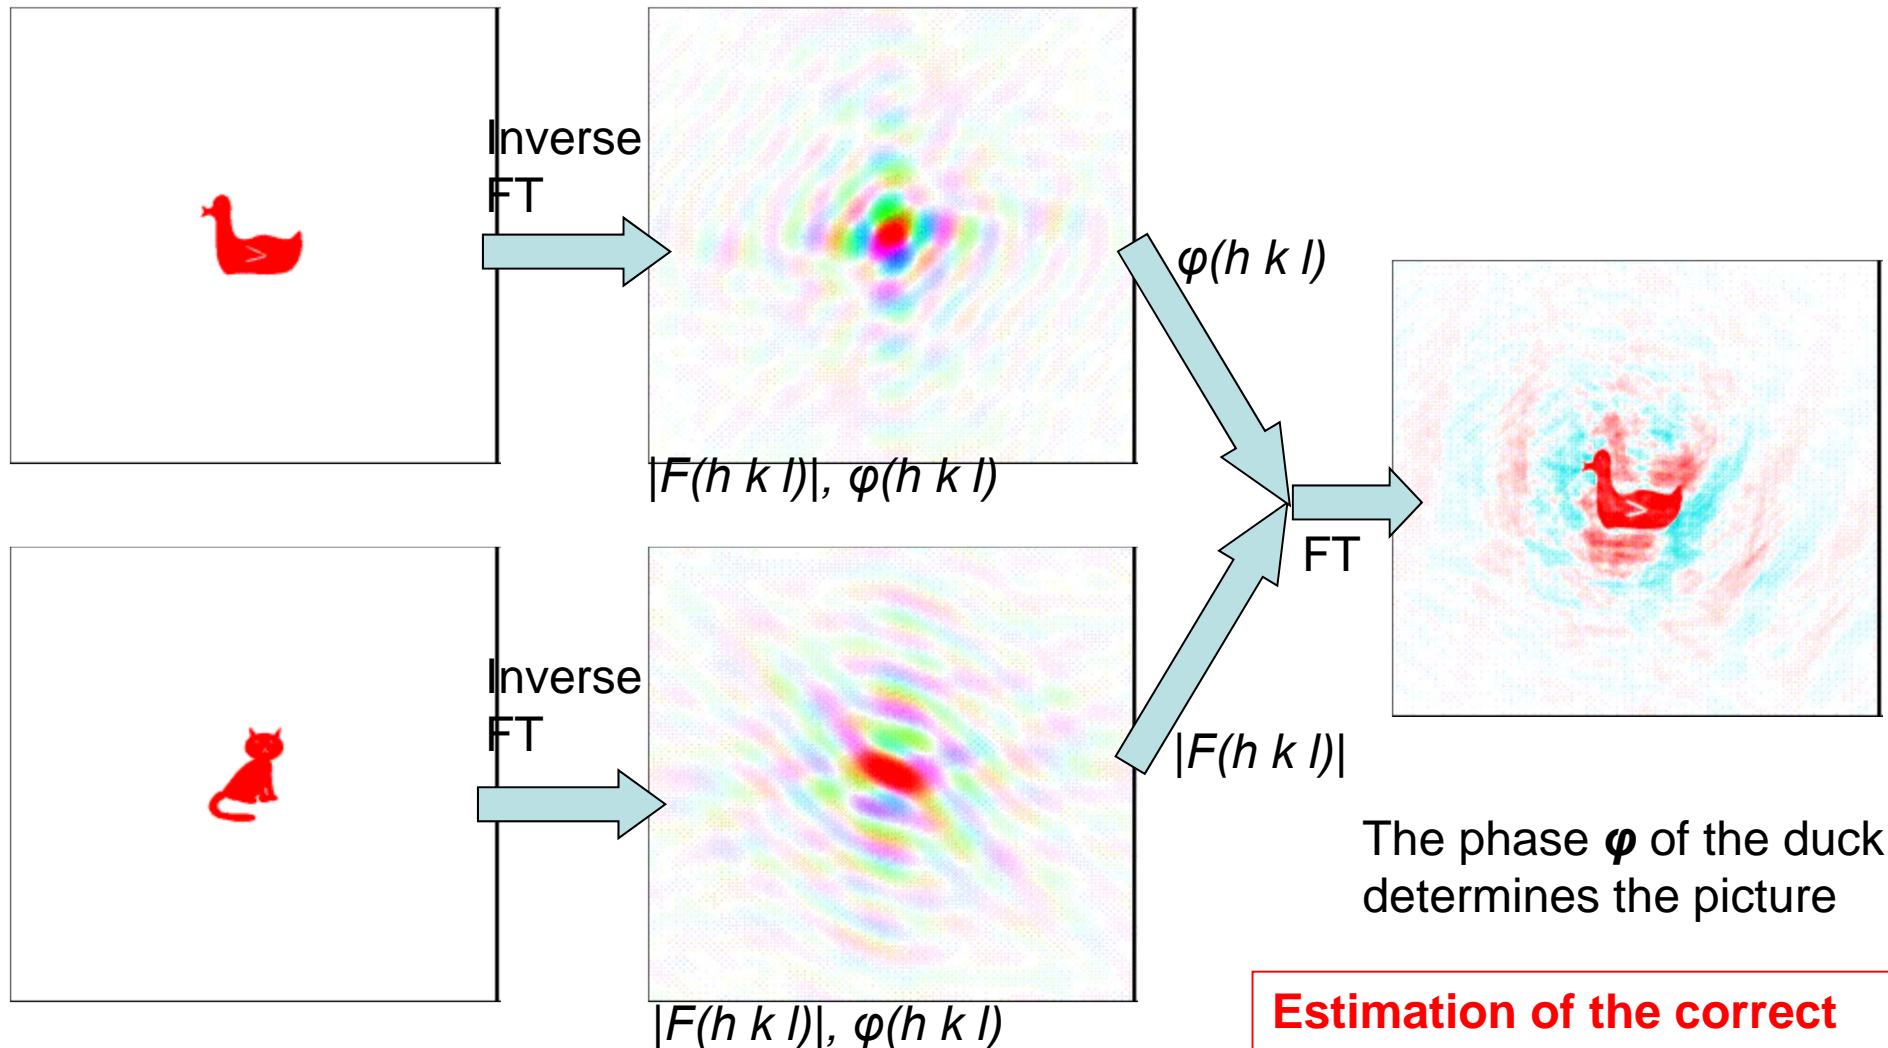

The structure factors can be calculated by molecular coordinates. Consistency between the calculated F (F_{calc}) and the observed F (F_{obs}) indicates a reliability of the structure.

phase

Importance of Phase

The phase of the structure factor contains the main information about the shape of the molecule.

Estimation of the correct phase is quite important!!

resolution & electron density map

4,5-diamino-2-chloropyrimidine

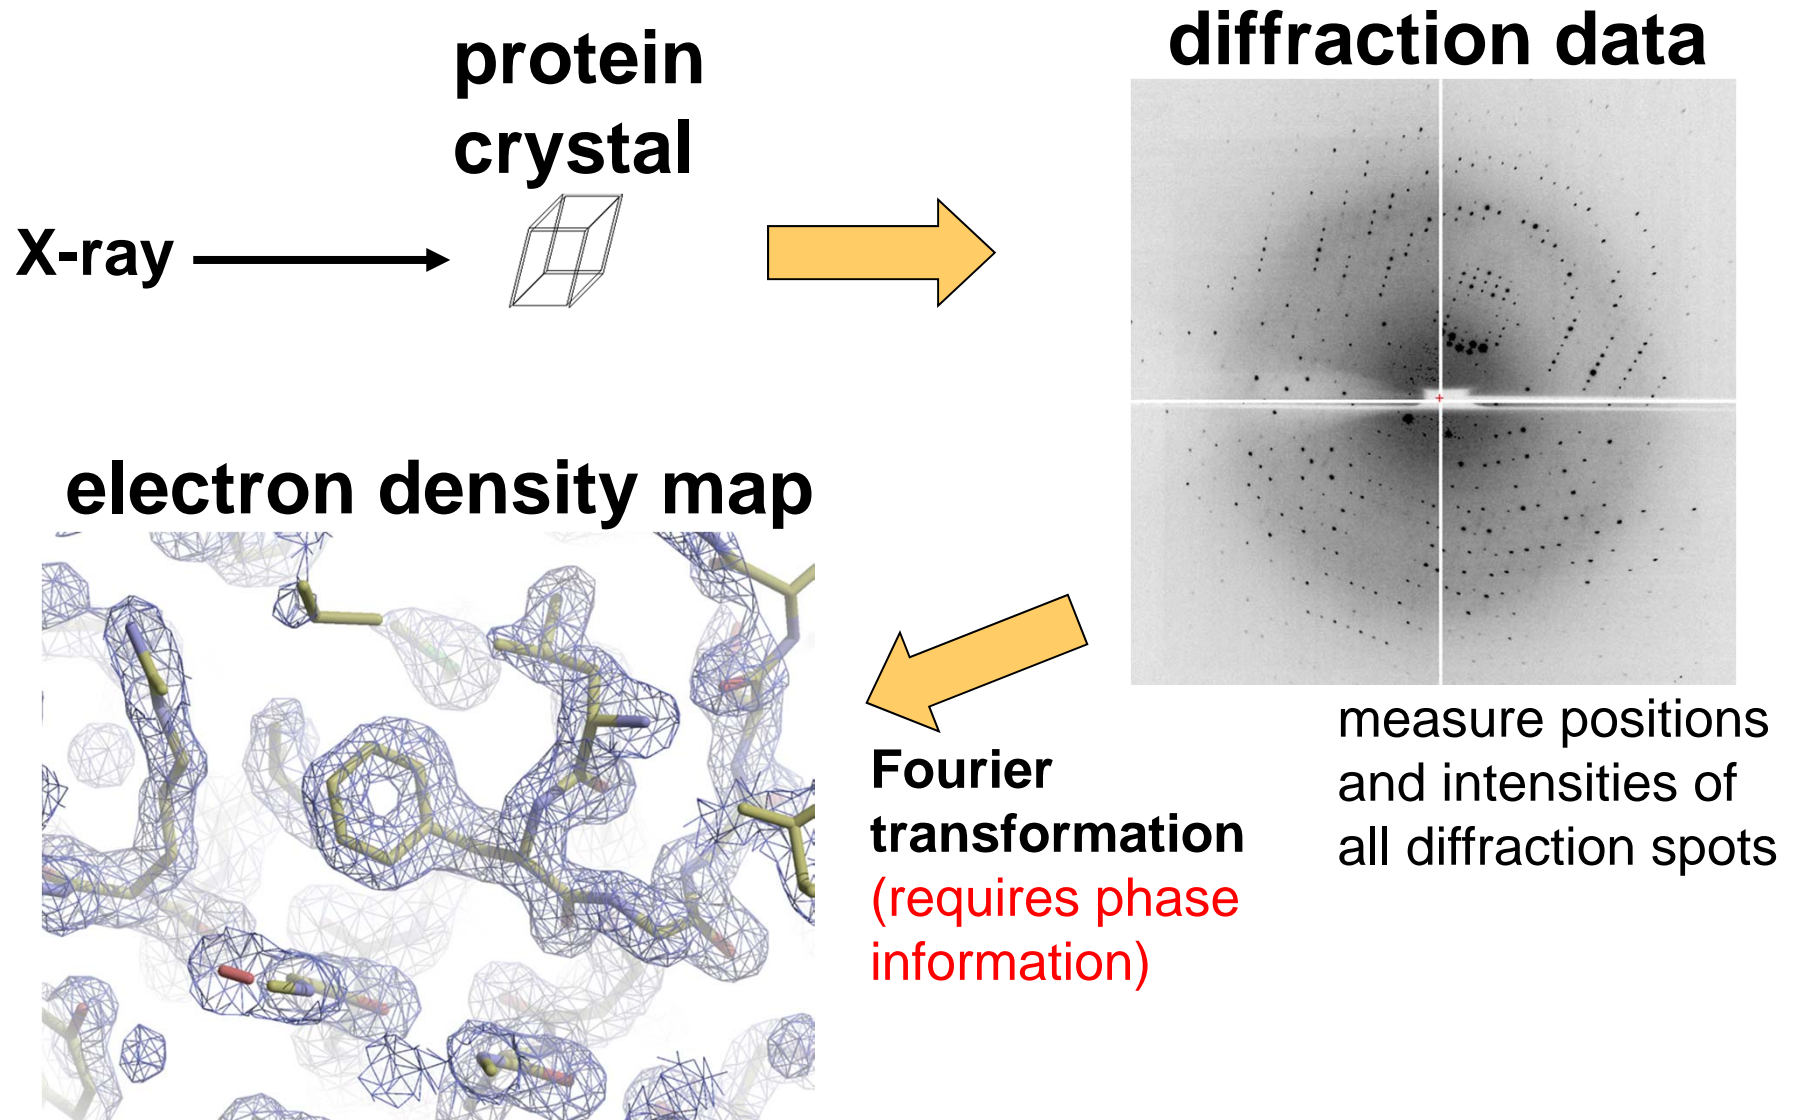

Resolution and electron density map

Movie from <http://ucxray.berkeley.edu/~jamesh/movies/>

- < 1.0 Å: Hydrogen atom can be detected.
- < 2.5 Å: Side chains can be easily detected.
- > 4.0 Å: Detection of side chains is very difficult.

X-ray crystal structure analysis

Electron density and molecular model

We can obtain only electron density map from diffraction experiments because X-rays are diffracted by electrons but not by atomic nucleus.

Based on the electron density map, we can build a molecular model.

Crystallization of Proteins

(vapor diffusion method)

-  sample drop (protein solution + precipitant)
-  precipitant molecules
-  water molecules
-  protein crystals

結晶のすくい方

実体顕微鏡を覗きながら、ループですくいます。あまり、倍率を上げ過ぎないのがコツ。倍率を上げ過ぎると、指先の震えが大きく見えるので、かえって操作が難しくなる。

Data collection

(1 degree oscillation X 180 frames)
